

Hera Protocol Compliance Audit Report

Confidential | Customer Demo Artifact

Report ID:

aceb5496-f33c-479a-85eb-7b65dda6bd87

Generated:

2026-05-13T03:55:14.746500+00:00

Chain:

Namada

Network:

Mainnet

Audit Period:

No canonical events available

Status:

Signed canonical JSON artifact available

Audit Scope

This report summarizes user-authorized shielded activity reconstructed from read-only viewing capability. Hera does not require spending authority and does not move funds. The PDF is derived from the signed canonical JSON manifest. Chain-specific interpretation remains separate below the normalization layer, while the exported report stays chain-agnostic above it.

1. Audit Scope

Networks Scanned:

Namada (Mainnet)

Viewing Scope:

Read-only viewing capability supplied for authorized compliance review

Audit Period:

No canonical events available

Included In This Report

- Owned shielded activity reconstructed from the supplied viewing scope
- Normalized event timeline covering receives, sends, shielding, unshielding, and fees
- Asset-level totals derived from canonical event amounts
- Evidence references and detached signature metadata for independent verification

Explicit Limitations

- Counterparty visibility may remain unknown or partial because shielded protocols intentionally limit disclosure
- The PDF is a human-readable derivative; the signed JSON manifest remains the machine-verifiable source of truth
- Compliance conclusions still require institutional review and policy interpretation

4. Security And Compliance Notes

Viewing Key Handling

- Submission occurs over TLS and viewing capability is encrypted immediately on arrival
- The application flow is designed for read-only scanning and does not require spending authority
- Tenant isolation, audit logging, and signed export artifacts remain part of the core control surface

Reporting Notes

- Canonical JSON is the source of truth for downstream verification and machine processing
- PDF output is generated from normalized events and detached report signature metadata
- Unknown or partial counterparty visibility is preserved explicitly and never filled in speculatively

Institutional Review Reminder

This artifact is intended to support compliance review, internal controls, and external explanation of reconstructed shielded activity. Final legal determinations remain the responsibility of the institution and its counsel.

Independent verification should be performed against the canonical JSON artifact. If a PDF rendering and canonical JSON ever diverge, the signed JSON controls.
